

GOVT 10: Setup Guide (Windows)

Installing R, Positron, Claude, and GitHub Desktop on Windows

Sean Westwood

Table of contents

1 Before you begin	1
2 Install R	2
3 Install Positron	2
3.1 First-run setup	3
4 Set up Claude	3
5 Create a GitHub account	3
5.1 Sign up	3
5.2 Install the GitHub Desktop app	3
5.3 Sign in and configure	4
5.4 Clone the class repo	4
5.5 Open the course folder in Positron	4
5.6 Run the course setup script	5
6 Quick reference	5

1 Before you begin

Set aside about **45 minutes** in a quiet place with a reliable internet connection. You will install four tools and create one account. Please read each step before starting.

What you will install

1. **R** — the statistical programming language
2. **Positron** — the editor we will use to write and run R code
3. **Claude** — the AI assistant
4. **GitHub Desktop** — the app that handles Git and pushes your work to GitHub
5. **GitHub account** — where you will store and share your work

Order matters. Install in the order listed above. Several tools look for the others during their own installation; if R isn't on your machine when Positron starts, Positron won't find it later without extra steps.

Do these checks first:

- Your PC must have at least **8 GB RAM** and **15 GB free disk space**.
- Your operating system must be **Windows 10 or Windows 11, 64-bit**.
- You need **administrator rights** on the PC. (If it's a managed work laptop, please switch to a personal device.)
- You will need an **email address** and a way to receive verification codes.

2 Install R

R is the statistical programming language we use to analyze data. Positron uses R under the hood — if R isn't installed, Positron has nothing to run.

1. Open Edge (or any browser) and go to <https://cran.r-project.org/bin/windows/base/>
2. Click the big link at the top: **Download R-4.x.x for Windows**.
3. Open the downloaded `.exe` file in your Downloads folder. Windows may show a “Did this app come from a trusted source?” warning — choose **More info** then **Run anyway**. CRAN is the official R distribution and is safe.
4. Step through the installer. Accept the defaults at every screen — do not change the install path.
5. When the installer finishes, close it. **You will never open R directly**. Positron will start R for you.

3 Install Positron

Positron is the editor we will use all term. It looks similar to VS Code (if you've seen that) but is purpose-built for R and data work. It is free and made by the same team that builds RStudio.

1. Go to <https://positron.posit.co/>
2. Click **Download for Windows**. You'll get a `.exe` installer in your Downloads folder.
3. Open the `.exe`. Windows SmartScreen may say “Windows protected your PC” — click **More info** then **Run anyway**.
4. Step through the installer. When you reach the “Select Additional Tasks” screen, **check the box for “Add Positron to PATH”** and **“Create a desktop shortcut”**.
5. Finish the installer. Open Positron from the Start menu or the desktop shortcut.

3.1 First-run setup

1. When Positron opens for the first time, it shows a Welcome page.
2. Positron will automatically find your R installation and offer to start a fresh R session. Click **Start R**. If you see “No R installation found”, restart your PC and reopen Positron — this usually happens when R was installed in the same session and the PATH hasn’t refreshed.
3. In the bottom panel you should see an **R Console** with a prompt that looks like `>`. Type:

```
2 + 2
```

and press Enter. You should see `[ 1 ] 4`. R is working.

Positron is installed when `2 + 2` returns `[ 1 ] 4` in the R Console and Positron starts cleanly.

Leave Positron open. We will come back to it after cloning the class repo and running the setup script.

4 Set up Claude

We use Claude in this class. Dartmouth provides a license.

5 Create a GitHub account

GitHub is where you will store your code, push your assignments, and (if you want) build a portfolio for future internships and jobs.

5.1 Sign up

1. Go to <https://github.com/>
2. Click **Sign up** in the top-right.
3. Use the **same Dartmouth email** you used for Claude. Choose a username that is professional — it appears on every repository you create and is hard to change later. Many people use a variant of their real name.
4. GitHub will email a verification code. Enter it.
5. Pick the **free plan** when asked.

5.2 Install the GitHub Desktop app

GitHub Desktop is the official desktop app for GitHub. It installs Git under the hood (so Positron will find Git automatically), lets you clone, commit, and push through buttons rather than the terminal, and handles sign-in once for the whole machine.

1. Go to <https://desktop.github.com/>
2. Click **Download for Windows**. Save the .exe to your Downloads folder.
3. Open the .exe. The app installs and launches automatically. (If Windows SmartScreen warns you, choose **More info** → **Run anyway**.)

5.3 Sign in and configure

1. On the welcome screen of GitHub Desktop, click **Sign in to GitHub.com**.
2. Your browser opens. Click **Authorize desktop**. Approve the access request.
3. The browser will ask to “open GitHub Desktop?” — click **Open**.
4. Back in the app, you will be asked to **Configure Git**. It pre-fills your name and email from your GitHub account. Confirm both — this is the identity that will appear on every commit you make.
5. Click **Finish**.

You're set up. GitHub Desktop's main window shows “No repositories found” — that's expected. We'll clone the course repo next.

5.4 Clone the class repo

The course materials — lectures, exercises, data, the setup script — all live in a GitHub repository. Clone it once and GitHub Desktop will keep your local copy in sync.

1. In GitHub Desktop, click **File** → **Clone repository...** (or **Clone a repository from the Internet...** on the welcome screen).
2. Switch to the **URL** tab.
3. Paste the class repo URL: <https://github.com/seanjw/govt10Summer2026>
4. For “Local path”, click **Choose...** and pick a folder where you'd like the materials to live. Your **Documents** folder is a good default — GitHub Desktop will create a subfolder for the repo.
5. Click **Clone**. The download takes a minute or two.
6. When it finishes, GitHub Desktop shows the repo as your “Current repository” at the top-left.

Where did the files go? GitHub Desktop tells you. Click **Repository** → **Show in Explorer** to open the local folder. You should see week folders, the syllabus, and `setup.R` sitting at the top level.

5.5 Open the course folder in Positron

Now switch to **Positron** and open the folder you just cloned. Open the whole *folder* — not a single file — so Positron treats the entire repo as your “project” for the term and can see the data, the setup script, and every week's materials at once.

1. Open **Positron**.

2. Click **File** → **Open Folder....**
3. Navigate to the folder GitHub Desktop just cloned and select it, then click **Select Folder**. If you're not sure where it lives, switch back to GitHub Desktop and click **Repository** → **Show in Explorer** — it's usually inside your **Documents** folder (e.g. `Documents\govt10Summer2026`).
4. If Positron asks “**Do you trust the authors of the files in this folder?**”, click **Yes, I trust the authors**.

How do I know it worked? The **Explorer** panel on the left lists the repo's contents — the week folders, the syllabus, and `setup.R` at the top level. That panel is your map of the course materials all term. (If the Explorer is hidden, click the top icon in the left activity bar or press **Ctrl+Shift+E**.)

5.6 Run the course setup script

Now that the course folder is open in Positron, run the setup script that came with it.

1. In the **Explorer** panel on the left, click **setup.R** to open it in the editor.
2. Press **Ctrl+A** to select the whole file, then **Ctrl+Enter** to run the selection.
3. The script will print progress messages in the R Console as it downloads packages. **This takes 10–15 minutes**. Don't close Positron; let it finish.
4. When the Console shows the prompt `>` again with no red error text, you're done. You may be asked questions. Just say 'yes' or pick a proximate location.

Help, something broke!

- **Restart your PC.** Half of “installation didn't work” problems resolve after a reboot — PATH variables and helper services need a clean start.
- **Read the exact error message.** Don't paraphrase; copy it.
- **Email me before class with the error.** Subject line: “GOVT 10 setup: [tool name]”. Attach a screenshot. I will reply quickly.
- Office hours (Wednesday 4:30–6:00 PM EST, by appointment) are the right time for any setup issues that survive these steps.

6 Quick reference

Before the first class: make sure all the tools above are installed. You should be able to:

- Open Positron and see `[1] 4` after running `2 + 2` in the R Console.
- Run `library(tidyverse)` in Positron without red errors (this confirms `setup.R`

succeeded).

- Sign into `claude.ai` in the browser.
- Open GitHub Desktop and see your GitHub username in the top-right.

If any of those checks fails, email me **before** class so we can fix it in advance.
